

How to PXE Boot In Virtualbox

By Juan Nevares

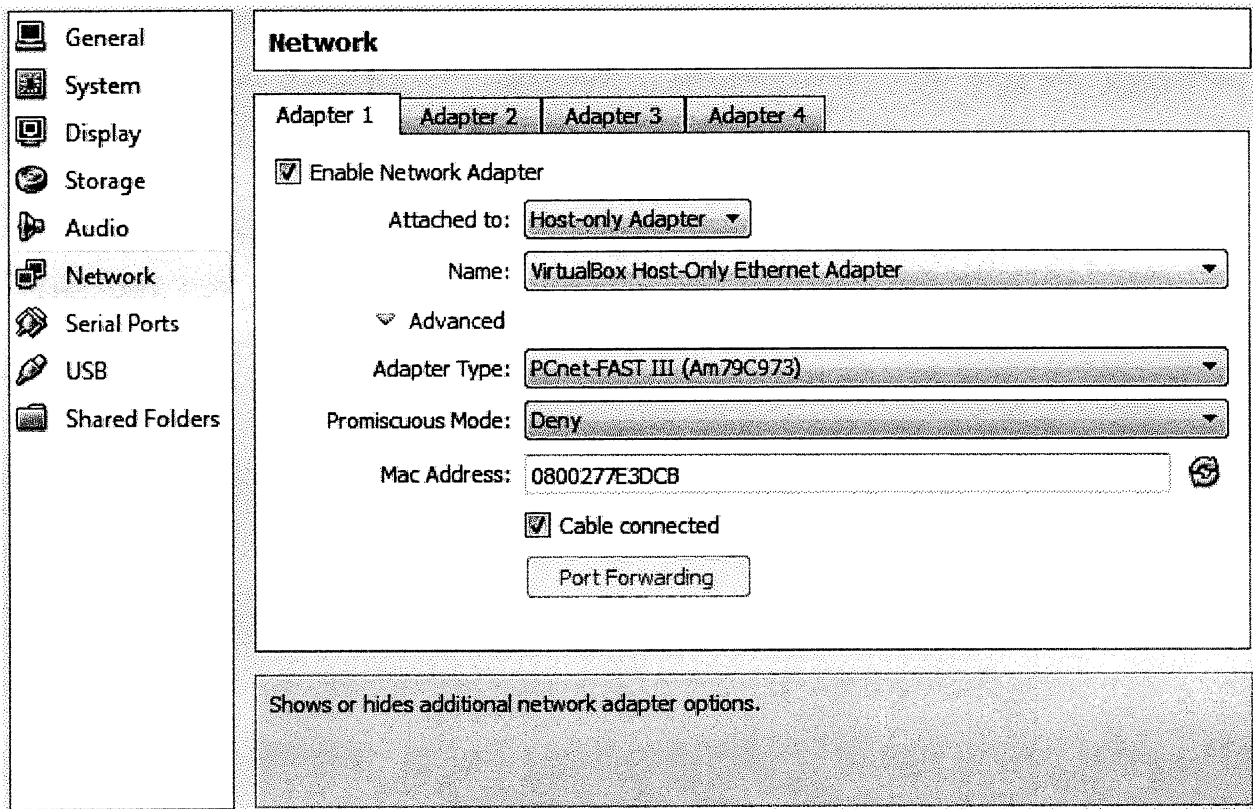

- 1) Create a Machine without any hard disk.

- 2) Next, Go into Settings > System, and make it the same as below.

3) Lastly, Go into Network, and make it the same as below.

4) And that's it! Make sure the Server is on and that it's configured for your client's MAC Address, which you can see in the same Network Setting in Virtualbox and that both your server and clients are the Same host-only adapter network.
